## Module Whats related

The `whats_related` module uses the [Categories](#) system to show you a list of items in the same category as the item you are viewing. Articles, Blogs, and wiki pages can all be shown in this module.

| Whats related                                                                                        |
|------------------------------------------------------------------------------------------------------|
| <b>wiki page:</b> Autos<br><b>article:</b> I really like my car<br><b>blog:</b> This is my auto blog |

## Parameters

Lists objects which share a category with the viewed object.

[Go to the source code](#)

*Preferences required:* `feature_categories`

| Parameters           |
|----------------------|
| <i>no parameters</i> |

Questions:

- Are there parameters that control which types of documents are shown, e.g. only wiki pages?
- Why do article hits show the header text instead of the article title?
