

New in [Tiki25](#), it permits to clean out [Preferences](#) for previously used but later removed features in Tiki.

Why is this needed? As a policy, Tiki doesn't delete data without a site admin's consent/knowledge. So when a feature is removed, what do we do with the associated data? Database tables are renamed to make it easy for an administrator to review and delete manually (or keep/move/etc.). However, preferences (configurations) are just kept in the database. So a tool like [Adminer](#) is needed to check for data and delete it. But it's tricky to what which data is no longer used. This feature permits Tiki admin to review and delete.

**As of Tiki26, please consider this feature as beta. Only use it if you are an experienced Tiki administrator.**

There is likely some data here that is actually still used, but in a non-standard way, so it fools our script.
