

Installing Tiki in a sub-directory

The ideal situation is to install your Tiki instance to serve the root of a domain or sub-domain

- `example.org/tiki-index_raw.php`
- `wiki.example.org/tiki-index_raw.php`

Installing in a sub-directory like this

- `example.org/wiki/tiki-index_raw.php`

Things to watch out for:

- Review your settings for CalDAV and CardDAV.

Related preferences

- `feature_html_head_base_tag` (Add base tag in the HTML head section. The base tag specifies a default address for all links on a page.)
