

Theme Layout Schema

This page provides a few diagrams that are useful for developers and/or theme designers.
For more information on Themes see <http://themes.tiki.org>

Lite CSS

iki ≥ 3.0 uses a table-less layout templates (XHTML + PHP Smarty syntax) and has a CSS base called **lite CSS** which is used to create a basic column layout to render the columns properly across all browsers. This CSS uses a nice trick to ensure the main column floats nicely alongside the left column even in IE6 etc. You will see in the diagram below that though column1 (the main content area) appears first in the code, it will always render between columns 2 and 3

Smarty Templates

The **tiki.tpl** file in the templates/ folder is the master template and includes other templates.

Schema for CSS

The main schema that Tiki ≥ 3 uses for layout is shown here, which also shows a "shadow" layer of extra divs used for design purposes like adding drop shadows.
