

## Matomo Web analytics

“

*Matomo, formerly known as Piwik, is a downloadable, Free (GPL licensed) web analytics software platform. It provides detailed reports on your website and its visitors, including the search engines and keywords they used, the language they speak, which pages they like, the files they download and so much more. Matomo (Piwik) aims to be an open source alternative to Google Analytics.*

Source: [https://matomo.org/faq/new-to-piwik/#faq\\_13](https://matomo.org/faq/new-to-piwik/#faq_13) 

Like Tiki, Matomo is written in PHP and uses a MySQL database.

## Integrating Matomo with Tiki

To record visitors, visits and page views in Matomo, you must add a Tracking code in all your pages. Matomo recommend to use the standard JavaScript Tracking tag.

The documentation is here:

<http://matomo.org/docs/javascript-tracking/>

Copy the code from Matomo and paste in Admin -> Look & Feel -> General Layout or Customization (depends on your version of Tiki) -> **Custom End of**

**Code** surrounded by literal tags, as shown below:

**In Tiki5 or newer**

```
{literal} {/literal}
```

The literal tags indicate to the Smarty template engine not to interpret the code and to pass it as-is.

direct URL to access **Custom End of**

**Code** is: tiki-admin.php?page=look&cookietab=2

**Only use the tracking code for users that do not have full admin rights**

```
{if $tiki_p_admin neq 'y'} {literal} {/literal} {/if}
```

## Going Further

To identify users logged into Tiki and track their activity, modify the default Matomo code to pass the Tiki username to Matomo . This is done by adding the following in Admin -> Look & Feel -> **Custom End of**

**Code.** Note that the Tiki username must be passed before 'trackPageView' in the default Matomo code to track user activity reliably.

**Pass Tiki username to Matomo, see analytics of user activity in Matomo reports**

```
{literal} {/literal}
```

## Matomo Visitor Log with Tiki user information

The screenshot displays the Matomo Visitor Log interface. On the left is a sidebar menu with options: Dashboard, Visitors (selected), Overview, Visitor Log, Users, Custom Variables, Devices, Software, Locations, Engagement, Times, Real-time Map, username, Actions, Referrers, and Goals. The main area is titled 'Visitor Log' and shows a list of visitor sessions. The first session is for user 'admin' on Sunday, February 12, 2017, at 14:10:30, with IP 47.15.0.210, showing 1 action. The second session is for user 'admin' at 12:37:27, with IP 47.15.0.210, showing 5 actions. The third session is for an anonymous user (IP 64.74.215.131) at 10:37:15, showing 1 action. The fourth session is for an anonymous user (IP 47.15.0.210) at 05:38:55, showing 14 actions. Each session entry includes a list of actions with their URLs.

Matomo Visitor Log shows activity of Tiki user 'admin' in the first two sessions and an anonymous user in the session after that

## Embedding Matomo report on a wiki page

It is possible to embed Matomo report into wiki page.

- In Matomo Admin
  - Permission and User
    1. Go to setting, users.
    2. Set permission for anonymous so all the data will be public or create a specific user to create a token that will be used for authentication ([recommended and explained here](#)).
    3. In Manage Access give this user "View" permission for the website(s) you want the token to be used to share the report.
  - Report Selection and Credentials
    1. Click on the user icon (top right), select widget
    2. Select the kind of report you want to display and copy the HTML code found in the field "Embed Iframe" (at the bottom of the preview). Paste it in a text-editor.
    3. Add at the end of the "src" (it should start by "http://example.org...") the parameter to the API calls URLs that require authentication: "&token\_auth=". Paste the token\_auth you created for your specific user.

You have now all the necessary and basic code that should be placed in a Tiki Wiki page.

- In Tiki

1. Create or edit the page where you want to display the report.
  2. Set permission for your usage (it can be embedded inside group plugin for example).
  3. Insert an HTML plugin and paste the code you've prepared.
  4. Approve the plugin
  5. Tada !
-
