

Plugin A Name

This [wiki plugin](#), available since Tiki1, creates an anchor in a wiki page that can be linked to. Use in conjunction with the [PluginAlink](#), which creates the link to the anchor.

Starting with Tiki release 2.0, Tiki will automatically create anchor points for all headings in a wiki page. You can use the [PluginAlink](#) to link to any heading on a wiki page *without* having to use a corresponding ANAME plugin.

Parameters

Create an anchor that can be linked to
Introduced in Tiki 1.
[Go to the source code](#)
Preferences required: wikiplugin_aname

Parameters
<i>(body of plugin)</i> - The name of the anchor.
<i>no parameters</i>

Usage

To take use this plugin in a wiki page, use the syntax:

```
{ANAME()}anchorname{ANAME}
```

In the generated XHTML for your webpage, Tiki will create the following anchor:

Notes:

- If you include spaces in the anchor name, Tiki will convert the spaces to underscores (_).
For example, {ANAME()}my custom anchor{ANAME} will render as: .
- Starting with Tiki release 2, Tiki generates the anchor using the id attribute. In prior releases, Tiki used the HTML name attribute ().

Example

Aname Plugin Usage

```
{ANAME( )}
```

anchername <--put the name of the anchor here. Use this same name for the aname= parameter in the Plugin Alink (see just below).

```
{ANAME}
```

ANAME example: {ANAME()}anchername{ANAME}

Alink Plugin Usage

```
{ALINK(
```

aname=anchername <-- put here the name of the anchor you created using the Plugin Aname!

```
)}
```

link text <-- put here the text to appear as the link.

```
{ALINK}
```

ALINK example: {ALINK(aname=anchername)}link text{ALINK}

or rather, I only work so

ALINK example: -+{ALINK(aname="anchername" pagename="wiki pagename") }link text{ALINK}+

Demonstration

To jump down to the anchor at the bottom of the page click [HERE](#). <-- Here is where I put the ALINK plugin in this page.

[illegible]

Here is a second [link](#) to the same anchor at the bottom of the page. Again, I used the ALINK plugin.

[illegible]

The anchor is here. <-- I put the ANAME plugin at the beginning of this line. Now you can click [HERE](#) to jump to the anchor I put at the top of the page (you can't see where that one is unless you look into the page editor ☐)
